## Foreword

Kenya, like all African countries, focused on poverty alleviation at independence, perhaps due to the level of vulnerability of its populations but also as a result of the 'trickle down' economic discourses of the time, which assumed that poverty rather than distribution mattered - in other words, that it was only necessary to concentrate on economic growth because, as the country grew richer, this wealth would trickle down to benefit the poorest sections of society. Inequality therefore had a very low profile in political, policy and scholarly discourses. In recent years though, social dimensions such as levels of access to education, clean water and sanitation are important in assessing people's quality of life. Being deprived of these essential services deepens poverty and reduces people's well-being. Stark differences in accessing these essential services among different groups make it difficult to reduce poverty even when economies are growing. According to the Economist (June 1, 2013), a 1\% increase in incomes in the most unequal countries produces a mere 0.6 percent reduction in poverty. In the most equal countries, the same $1 \%$ growth yields a $4.3 \%$ reduction in poverty. Poverty and inequality are thus part of the same problem, and there is a strong case to be made for both economic growth and redistributive policies. From this perspective, Kenya's quest in vision 2030 to grow by $10 \%$ per annum must also ensure that inequality is reduced along the way and all people benefit equitably from development initiatives and resources allocated.

Since 2004, the Society for International Development (SID) and Kenya National Bureau of Statistics (KNBS) have collaborated to spearhead inequality research in Kenya. Through their initial publications such as 'Pulling Apart: Facts and Figures on Inequality in Kenya,' which sought to present simple facts about various manifestations of inequality in Kenya, the understanding of Kenyans of the subject was deepened and a national debate on the dynamics, causes and possible responses started. The report ‘Geographic Dimensions of Well-Being in Kenya: Who and Where are the Poor?’ elevated the poverty and inequality discourse further while the publication 'Readings on Inequality in Kenya: Sectoral Dynamics and Perspectives' presented the causality, dynamics and other technical aspects of inequality.

KNBS and SID in this publication go further to present monetary measures of inequality such as expenditure patterns of groups and non-money metric measures of inequality in important livelihood parameters like employment, education, energy, housing, water and sanitation to show the levels of vulnerability and patterns of unequal access to essential social services at the national, county, constituency and ward levels.

We envisage that this work will be particularly helpful to county leaders who are tasked with the responsibility of ensuring equitable social and economic development while addressing the needs of marginalized groups and regions. We also hope that it will help in informing public engagement with the devolution process and be instrumental in formulating strategies and actions to overcome exclusion of groups or individuals from the benefits of growth and development in Kenya.

It is therefore our great pleasure to present 'Exploring Kenya's inequality: Pulling apart or pooling together?'

## Acknowledgements

Kenya National Bureau of Statistics (KNBS) and Society for International Development (SID) are grateful to all the individuals directly involved in the publication of 'Exploring Kenya's Inequality: Pulling Apart or Pulling Together?' books. Special mention goes to Zachary Mwangi (KNBS, Ag. Director General) and Ali Hersi (SID, Regional Director) for their institutional leadership; Katindi Sivi-Njonjo (SID, Progrmme Director) and Paul Samoei (KNBS) for the effective management of the project; Eston Ngugi; Tabitha Wambui Mwangi; Joshua Musyimi; Samuel Kipruto; George Kamula; Jason Lakin; Ali Zaidi; Leonard Wanyama; and Irene Omari for the different roles played in the completion of these publications.

KNBS and SID would like to thank Bernadette Wanjala (KIPPRA), Mwende Mwendwa (KIPPRA), Raphael Munavu (CRA), Moses Sichei (CRA), Calvin Muga (TISA), Chrispine Oduor (IEA), John T. Mukui, Awuor Ponge (IPAR, Kenya), Othieno Nyanjom, Mary Muyonga (SID), Prof. John Oucho (AMADPOC), Ms. Ada Mwangola (Vision 2030 Secretariat), Kilian Nyambu (NCIC), Charles Warria (DAP), Wanjiru Gikonyo (TISA) and Martin Napisa (NTA), for attending the peer review meetings held on $3^{\text {rd }}$ October 2012 and Thursday, $28^{\text {th }}$ Feb 2013 and for making invaluable comments that went into the initial production and the finalisation of the books. Special mention goes to Arthur Muliro, Wambui Gathathi, Con Omore, Andiwo Obondoh, Peter Gunja, Calleb Okoyo, Dennis Mutabazi, Leah Thuku, Jackson Kitololo, Yvonne Omwodo and Maureen Bwisa for their institutional support and administrative assistance throughout the project. The support of DANIDA through the Drivers of Accountability Project in Kenya is also gratefully acknowledged.

## Striking Features on Intra-County Inequality in Kenya

Inequalities within counties in all the variables are extreme. In many cases, Kenyans living within a single county have completely different lifestyles and access to services.

## Income/expenditure inequalities

1. The five counties with the worst income inequality (measured as a ratio of the top to the bottom decile) are in Coast. The ratio of expenditure by the wealthiest to the poorest is 20 to one and above in Lamu, Tana River, Kwale, and Kilifi. This means that those in the top decile have 20 times as much expenditure as those in the bottom decile. This is compared to an average for the whole country of nine to one.
2. Another way to look at income inequality is to compare the mean expenditure per adult across wards within a county. In 44 of the 47 counties, the mean expenditure in the poorest wards is less than 40 percent the mean expenditure in the wealthiest wards within the county. In both Kilifi and Kwale, the mean expenditure in the poorest wards (Garashi and Ndavaya, respectively) is less than 13 percent of expenditure in the wealthiest ward in the county.
3. Of the five poorest counties in terms of mean expenditure, four are in the North (Mandera, Wajir, Turkana and Marsabit) and the last is in Coast (Tana River). However, of the five most unequal counties, only one (Marsabit County) is in the North (looking at ratio of mean expenditure in richest to poorest ward). The other four most unequal counties by this measure are: Kilifi, Kwale, Kajiado and Kitui.
4. If we look at Gini coefficients for the whole county, the most unequal counties are also in Coast: Tana River (.631), Kwale (.604), and Kilifi (.570).
5. The most equal counties by income measure (ratio of top decile to bottom) are: Narok, West Pokot, Bomet, Nandi and Nairobi. Using the ratio of average income in top to bottom ward, the five most equal counties are: Kirinyaga, Samburu, Siaya, Nyandarua, Narok.

## Access to Education

6. Major urban areas in Kenya have high education levels but very large disparities. Mombasa, Nairobi and Kisumu all have gaps between highest and lowest wards of nearly 50 percentage points in share of residents with secondary school education or higher levels.
7. In the 5 most rural counties (Baringo, Siaya, Pokot, Narok and Tharaka Nithi), education levels are lower but the gap, while still large, is somewhat lower than that espoused in urban areas. On average, the gap in these 5 counties between wards with highest share of residents with secondary school or higher and those with the lowest share is about 26 percentage points.
8. The most extreme difference in secondary school education and above is in Kajiado County where the top ward (Ongata Rongai) has nearly 59 percent of the population with secondary education plus, while the bottom ward (Mosiro) has only 2 percent.
9. One way to think about inequality in education is to compare the number of people with no education
to those with some education. A more unequal county is one that has large numbers of both. Isiolo is the most unequal county in Kenya by this measure, with 51 percent of the population having no education, and 49 percent with some. This is followed by West Pokot at 55 percent with no education and 45 percent with some, and Tana River at 56 percent with no education and 44 with some.

## Access to Improved Sanitation

10. Kajiado County has the highest gap between wards with access to improved sanitation. The best performing ward (Ongata Rongai) has 89 percent of residents with access to improved sanitation while the worst performing ward (Mosiro) has 2 percent of residents with access to improved sanitation, a gap of nearly 87 percentage points.
11. There are 9 counties where the gap in access to improved sanitation between the best and worst performing wards is over 80 percentage points. These are Baringo, Garissa, Kajiado, Kericho, Kilifi, Machakos, Marsabit, Nyandarua and West Pokot.

## Access to Improved Sources of Water

12. In all of the 47 counties, the highest gap in access to improved water sources between the county with the best access to improved water sources and the least is over 45 percentage points. The most severe gaps are in Mandera, Garissa, Marsabit, (over 99 percentage points), Kilifi (over 98 percentage points) and Wajir (over 97 percentage points).

## Access to Improved Sources of Lighting

13. The gaps within counties in access to electricity for lighting are also enormous. In most counties (29 out of 47), the gap between the ward with the most access to electricity and the least access is more than 40 percentage points. The most severe disparities between wards are in Mombasa (95 percentage point gap between highest and lowest ward), Garissa (92 percentage points), and Nakuru (89 percentage points).

## Access to Improved Housing

14. The highest extreme in this variable is found in Baringo County where all residents in Silale ward live in grass huts while no one in Ravine ward in the same county lives in grass huts.

## Overall ranking of the variables

15. Overall, the counties with the most income inequalities as measured by the gini coefficient are Tana River, Kwale, Kilifi, Lamu, Migori and Busia. However, the counties that are consistently mentioned among the most deprived hence have the lowest access to essential services compared to others across the following nine variables i.e. poverty, mean household expenditure, education, work for pay, water, sanitation, cooking fuel, access to electricity and improved housing are Mandera (8 variables), Wajir (8 variables), Turkana (7 variables) and Marsabit (7 variables).

## Introduction

## Background

For more than half a century many people in the development sector in Kenya have worked at alleviating extreme poverty so that the poorest people can access basic goods and services for survival like food, safe drinking water, sanitation, shelter and education. However when the current national averages are disaggregated there are individuals and groups that still lag too behind. As a result, the gap between the rich and the poor, urban and rural areas, among ethnic groups or between genders reveal huge disparities between those who are well endowed and those who are deprived.

According to the world inequality statistics, Kenya was ranked 103 out of 169 countries making it the 66th most unequal country in the world. Kenya's Inequality is rooted in its history, politics, economics and social organization and manifests itself in the lack of access to services, resources, power, voice and agency. Inequality continues to be driven by various factors such as: social norms, behaviours and practices that fuel discrimination and obstruct access at the local level and/ or at the larger societal level; the fact that services are not reaching those who are most in need of them due to intentional or unintentional barriers; the governance, accountability, policy or legislative issues that do not favor equal opportunities for the disadvantaged; and economic forces i.e. the unequal control of productive assets by the different socio-economic groups.

According to the 2005 report on the World Social Situation, sustained poverty reduction cannot be achieved unless equality of opportunity and access to basic services is ensured. Reducing inequality must therefore be explicitly incorporated in policies and programmes aimed at poverty reduction. In addition, specific interventions may be required, such as: affirmative action; targeted public investments in underserved areas and sectors; access to resources that are not conditional; and a conscious effort to ensure that policies and programmes implemented have to provide equitable opportunities for all.

This chapter presents the basic concepts on inequality and poverty, methods used for analysis, justification and choice of variables on inequality. The analysis is based on the 2009 Kenya housing and population census while the 2006 Kenya integrated household budget survey is combined with census to estimate poverty and inequality measures from the national to the ward level. Tabulation of both money metric measures of inequality such as mean expenditure and non-money metric measures of inequality in important livelihood parameters like, employment, education, energy, housing, water and sanitation are presented. These variables were selected from the census data and analyzed in detail and form the core of the inequality reports. Other variables such as migration or health indicators like mortality, fertility etc. are analyzed and presented in several monographs by Kenya National Bureau of Statistics and were therefore left out of this report.

## Methodology

## Gini-coefficient of inequality

This is the most commonly used measure of inequality. The coefficient varies between ' 0 ', which reflects complete equality and ' 1 ' which indicates complete inequality. Graphically, the Gini coefficient can be
easily represented by the area between the Lorenz curve and the line of equality. On the figure below, the Lorenz curve maps the cumulative income share on the vertical axis against the distribution of the population on the horizontal axis. The Gini coefficient is calculated as the area (A) divided by the sum of areas $(A$ and $B)$ i.e. $A /(A+B)$. If $A=0$ the Gini coefficient becomes 0 which means perfect equality, whereas if $\mathrm{B}=0$ the Gini coefficient becomes 1 which means complete inequality. Let xi be a point on the X -axis, and yi a point on the Y -axis, the Gini coefficient formula is:

Gini $=1 \square \prod_{i=1}^{N}\left(x_{i} \square x_{i \square \downarrow} \ell y_{i}+y_{i \square 1}\right)$.
An Illustration of the Lorenz Curve

## Small Area Estimation (SAE)

The small area problem essentially concerns obtaining reliable estimates of quantities of interest totals or means of study variables, for example - for geographical regions, when the regional sample sizes are small in the survey data set. In the context of small area estimation, an area or domain becomes small when its sample size is too small for direct estimation of adequate precision. If the regional estimates are to be obtained by the traditional direct survey estimators, based only on the sample data from the area of interest itself, small sample sizes lead to undesirably large standard errors for them. For instance, due to their low precision the estimates might not satisfy the generally accepted publishing criteria in official statistics. It may even happen that there are no sample members at all from some areas, making the direct estimation impossible. All this gives rise to the need of special small area estimation methodology.

Most of KNBS surveys were designed to provide statistically reliable, design-based estimates only at the national, provincial and district levels such as the Kenya Intergraded Household Budget Survey of 2005/06 (KIHBS). The sheer practical difficulties and cost of implementing and conducting sample surveys that would provide reliable estimates at levels finer than the district were generally prohibitive, both in terms of the increased sample size required and in terms of the added burden on providers of survey data (respondents). However through SAE and using the census and other survey datasets, accurate small area poverty estimates for 2009 for all the counties are obtainable.

The sample in the 2005/06 KIHBS, which was a representative subset of the population, collected detailed information regarding consumption expenditures. The survey gives poverty estimate of urban and rural poverty at the national level, the provincial level and, albeit with less precision, at the district level. However, the sample sizes of such household surveys preclude estimation of meaningful poverty measures for smaller areas such as divisions, locations or wards. Data collected through censuses are sufficiently large to provide representative measurements below the district level such as divisions, locations and sub-locations. However, this data does not contain the detailed information on consumption expenditures required to estimate poverty indicators. In small area estimation methodology, the first step of the analysis involves exploring the relationship between a set of characteristics of households and the welfare level of the same households, which has detailed information about household expenditure and consumption. A regression equation is then estimated to explain daily per capita consumption and expenditure of a household using a number of socio-economic variables such as household size, education levels, housing characteristics and access to basic services.

While the census does not contain household expenditure data, it does contain these socio-economic variables. Therefore, it will be possible to statistically impute household expenditures for the census households by applying the socio-economic variables from the census data on the estimated relationship based on the survey data. This will give estimates of the welfare level of all households in the census, which in turn allows for estimation of the proportion of households that are poor and other poverty measures for relatively small geographic areas. To determine how many people are poor in each area, the study would then utilize the 2005/06 monetary poverty lines for rural and urban households respectively. In terms of actual process, the following steps were undertaken:

Cluster Matching: Matching of the KIHBS clusters, which were created using the 1999 Population and Housing Census Enumeration Areas (EA) to 2009 Population and Housing Census EAs. The purpose was to trace the KIBHS 2005/06 clusters to the 2009 Enumeration Areas.

Zero Stage: The first step of the analysis involved finding out comparable variables from the survey (Kenya Integrated Household Budget 2005/06) and the census (Kenya 2009 Population and Housing Census). This required the use of the survey and census questionnaires as well as their manuals.

First Stage (Consumption Model): This stage involved the use of regression analysis to explore the relationship between an agreed set of characteristics in the household and the consumption levels of the same households from the survey data. The regression equation was then used to estimate and explain daily per capita consumption and expenditure of households using socio-economic variables
such as household size, education levels, housing characteristics and access to basic services, and other auxiliary variables. While the census did not contain household expenditure data, it did contain these socio-economic variables.

Second Stage (Simulation): Analysis at this stage involved statistical imputation of household expenditures for the census households, by applying the socio-economic variables from the census data on the estimated relationship based on the survey data.

## Identification of poor households Principal Component Analysis (PCA)

In order to attain the objective of the poverty targeting in this study, the household needed to be established. There are three principal indicators of welfare; household income; household consumption expenditures; and household wealth. Household income is the theoretical indicator of choice of welfare/ economic status. However, it is extremely difficult to measure accurately due to the fact that many people do not remember all the sources of their income or better still would not want to divulge this information. Measuring consumption expenditures has many drawbacks such as the fact that household consumption expenditures typically are obtained from recall method usually for a period of not more than four weeks. In all cases a well planned and large scale survey is needed, which is time consuming and costly to collect. The estimation of wealth is a difficult concept due to both the quantitative as well as the qualitative aspects of it. It can also be difficult to compute especially when wealth is looked at as both tangible and intangible.

Given that the three main indicators of welfare cannot be determined in a shorter time, an alternative method that is quick is needed. The alternative approach then in measuring welfare is generally through the asset index. In measuring the asset index, multivariate statistical procedures such the factor analysis, discriminate analysis, cluster analysis or the principal component analysis methods are used. Principal components analysis transforms the original set of variables into a smaller set of linear combinations that account for most of the variance in the original set. The purpose of PCA is to determine factors (i.e., principal components) in order to explain as much of the total variation in the data as possible.

In this project the principal component analysis was utilized in order to generate the asset (wealth) index for each household in the study area. The PCA can be used as an exploratory tool to investigate patterns in the data; in identify natural groupings of the population for further analysis and; to reduce several dimensionalities in the number of known dimensions. In generating this index information from the datasets such as the tenure status of main dwelling units; roof, wall, and floor materials of main dwelling; main source of water; means of human waste disposal; cooking and lighting fuels; household items such radio TV, fridge etc was required. The recent available dataset that contains this information for the project area is the Kenya Population and Housing Census 2009.

There are four main approaches to handling multivariate data for the construction of the asset index in surveys and censuses. The first three may be regarded as exploratory techniques leading to index construction. These are graphical procedures and summary measures. The two popular multivariate procedures - cluster analysis and principal component analysis (PCA) - are two of the key procedures that have a useful preliminary role to play in index construction and lastly regression modeling approach.

In the recent past there has been an increasing routine application of PCA to asset data in creating welfare indices (Gwatkin et al. 2000, Filmer and Pritchett 2001 and McKenzie 2003).

## Concepts and definitions

## Inequality

Inequality is characterized by the existence of unequal opportunities or life chances and unequal conditions such as incomes, goods and services. Inequality, usually structured and recurrent, results into an unfair or unjust gap between individuals, groups or households relative to others within a population. There are several methods of measuring inequality. In this study, we consider among other methods, the Gini-coefficient, the difference in expenditure shares and access to important basic services.

## Equality and Equity

Although the two terms are sometimes used interchangeably, they are different concepts. Equality requires all to have same/ equal resources, while equity requires all to have the same opportunity to access same resources, survive, develop, and reach their full potential, without discrimination, bias, or favoritism. Equity also accepts differences that are earned fairly.

## Poverty

The poverty line is a threshold below which people are deemed poor. Statistics summarizing the bottom of the consumption distribution (i.e. those that fall below the poverty line) are therefore provided. In 2005/06, the poverty line was estimated at Ksh1,562 and Ksh2,913 per adult equivalent ${ }^{1}$ per month for rural and urban households respectively. Nationally, 45.2 percent of the population lives below the poverty line (2009 estimates) down from 46 percent in 2005/06.

## Spatial Dimensions

The reason poverty can be considered a spatial issue is two-fold. People of a similar socio-economic background tend to live in the same areas because the amount of money a person makes usually, but not always, influences their decision as to where to purchase or rent a home. At the same time, the area in which a person is born or lives can determine the level of access to opportunities like education and employment because income and education can influence settlement patterns and also be influenced by settlement patterns. They can therefore be considered causes and effects of spatial inequality and poverty.

## Employment

Access to jobs is essential for overcoming inequality and reducing poverty. People who cannot access productive work are unable to generate an income sufficient to cover their basic needs and those of their families, or to accumulate savings to protect their households from the vicissitudes of the economy.

[^0]The unemployed are therefore among the most vulnerable in society and are prone to poverty. Levels and patterns of employment and wages are also significant in determining degrees of poverty and inequality. Macroeconomic policy needs to emphasize the need for increasing regular good quality 'work for pay' that is covered by basic labour protection. The population and housing census 2009 included questions on labour and employment for the population aged 15-64.

The census, not being a labour survey, only had few categories of occupation which included work for pay, family business, family agricultural holdings, intern/volunteer, retired/home maker, full time student, incapacitated and no work. The tabulation was nested with education- for none, primary and secondary level.

## Education

Education is typically seen as a means of improving people's welfare. Studies indicate that inequality declines as the average level of educational attainment increases, with secondary education producing the greatest payoff, especially for women (Cornia and Court, 2001). There is considerable evidence that even in settings where people are deprived of other essential services like sanitation or clean water, children of educated mothers have much better prospects of survival than do the children of uneducated mothers. Education is therefore typically viewed as a powerful factor in leveling the field of opportunity as it provides individuals with the capacity to obtain a higher income and standard of living. By learning to read and write and acquiring technical or professional skills, people increase their chances of obtaining decent, better-paying jobs. Education however can also represent a medium through which the worst forms of social stratification and segmentation are created. Inequalities in quality and access to education often translate into differentials in employment, occupation, income, residence and social class. These disparities are prevalent and tend to be determined by socio-economic and family background. Because such disparities are typically transmitted from generation to generation, access to educational and employment opportunities are to a certain degree inherited, with segments of the population systematically suffering exclusion. The importance of equal access to a well-functioning education system, particularly in relation to reducing inequalities, cannot be overemphasized.

## Water

According to UNICEF (2008), over 1.1 billion people lack access to an improved water source and over three million people, mostly children, die annually from water-related diseases. Water quality refers to the basic and physical characteristics of water that determines its suitability for life or for human uses. The quality of water has tremendous effects on human health both in the short term and in the long term. As indicated in this report, slightly over half of Kenya's population has access to improved sources of water.

## Sanitation

Sanitation refers to the principles and practices relating to the collection, removal or disposal of human excreta, household waste, water and refuse as they impact upon people and the environment. Decent sanitation includes appropriate hygiene awareness and behavior as well as acceptable, affordable and
sustainable sanitation services which is crucial for the health and wellbeing of people. Lack of access to safe human waste disposal facilities leads to higher costs to the community through pollution of rivers, ground water and higher incidence of air and water borne diseases. Other costs include reduced incomes as a result of disease and lower educational outcomes.

Nationally, 61 percent of the population has access to improved methods of waste disposal. A sizeable population i.e. 39 percent of the population is disadvantaged. Investments made in the provision of safe water supplies need to be commensurate with investments in safe waste disposal and hygiene promotion to have significant impact.

## Housing Conditions (Roof, Wall and Floor)

Housing conditions are an indicator of the degree to which people live in humane conditions. Materials used in the construction of the floor, roof and wall materials of a dwelling unit are also indicative of the extent to which they protect occupants from the elements and other environmental hazards. Housing conditions have implications for provision of other services such as connections to water supply, electricity, and waste disposal. They also determine the safety, health and well being of the occupants. Low provision of these essential services leads to higher incidence of diseases, fewer opportunities for business services and lack of a conducive environment for learning. It is important to note that availability of materials, costs, weather and cultural conditions have a major influence on the type of materials used.

## Energy fuel for cooking and lighting

Lack of access to clean sources of energy is a major impediment to development through health related complications such as increased respiratory infections and air pollution. The type of cooking fuel or lighting fuel used by households is related to the socio-economic status of households. High level energy sources are cleaner but cost more and are used by households with higher levels of income compared with primitive sources of fuel like firewood which are mainly used by households with a lower socio-economic profile. Globally about 2.5 billion people rely on biomass such as fuel-wood, charcoal, agricultural waste and animal dung to meet their energy needs for cooking.

Wajir County

## WAJIR COUNTY

Figure 46.1: Wajir Population Pyramid

## Population

Wajir County has a child rich population, where 0-14 year olds constitute $52 \%$ of the total population. This is due to very high fertility rates among women as shown by the highest percentage household size of more than 7+ members at $68 \%$. The lower proportion of $0-4$ year olds is due to high infant and under five mortality rates

## Employment

The 2009 population and housing census covered in brief the labour status as tabulated below. The main variable of interest for inequality discussed in the text is work for pay by level of education. The other variables, notably family business, family agricultural holdings, intern/volunteer, retired/homemaker, fulltime student, incapacitated and no work are tabulated and presented in the annex table 46.3 up to ward level.

Table 46: Overall Employment by Education Levels in Wajir County

| Education Level | Work for pay | Family Business | Family Agricultural Holding | Intern/ Volunteer | Retired/ Homemaker | Fulltime Student | Incapacitated | No work | Number of Individuals |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Total | 5.7 | 15.0 | 34.5 | 1.4 | 10.7 | 9.4 | 0.3 | 23.1 | 301,730 |
| None | 4.3 | 16.7 | 39.4 | 1.4 | 12.2 | 1.7 | 0.3 | 24.0 | 249,511 |
| Primary | 5.9 | 7.6 | 13.7 | 1.1 | 4.2 | 47.7 | 0.2 | 19.7 | 29,279 |
| Secondary+ | 20.1 | 5.8 | 8.6 | 1.2 | 2.4 | 44.2 | 0.1 | 17.6 | 22,940 |

In Wajir County, 4\% of the residents with no formal education, 6\% of those with a primary education and 20\% of those with a secondary level of education or above are working for pay. Work for pay is highest in Nairobi at 49\% and this is twice the level in Wajir for those with secondary level of education or above.

## Gini Coefficient

In this report, the Gini index measures the extent to which the distribution of consumption expenditure among individuals or households within an economy deviates from a perfectly equal distribution. A Gini index of ' 0 ' represents perfect equality, while an index of ' 1 ' implies perfect inequality. Wajir County's Gini index is 0.321 compared with Turkana County, which has the least inequality nationally (0.283).

Figure 46.2: Wajir County-Gini Coefficient by Ward

## Education

Figure 46.3: Wajir County-Percentage of Population by Education Attainment by Ward

Only 4\% of Wajir County residents have a secondary level of education or above. Wajir East constituency has the highest share of residents with a secondary level of education or above at $9 \%$. This is 8 percentage points above Tarbaj constituency, which has the lowest share of residents with a secondary level of education or above. Wajir East constituency is 5 percentage points above the county average. Township ward has the highest share of residents with a secondary level of education or above at $16 \%$. This is 15 percentage points above Sarman ward, which has the lowest share of residents with a secondary level of education or above. Township ward is 12 percentage points above the county average.

A total of $20 \%$ of Wajir County residents have a primary level of education only. Wajir East constituency has the highest share of residents with a primary level of education only at $29 \%$. This is twice Tarbaj constituency, which has the lowest share of residents with primary only. Wajir East constituency is 9 percentage points above the county average. Township ward has the highest share of residents with a primary level of education only at $37 \%$. This is almost four times Elben ward, which has the lowest share of residents with a primary only. Township ward is17 percentage points above the county average.

As many as $76 \%$ of, Wajir County residents have no formal education. Tarbaj constituency has the highest share of residents with no formal education at $86 \%$. This is 25 percentage points above Wajir East constituency, which has the lowest share of residents with no formal education. Tarbaj constituency is 10 percentage points above the county average. Elben ward has the highest percentage of residents with no formal education at $89 \%$. This is almost twice Township ward, which has the lowest percentage of residents with no formal education. Elben ward is 13 percentage points above the county average.

## Energy

Cooking Fuel
Figure 46.4: Percentage Distribution of Households by Source of Cooking Fuel in Wajir County

Less than $1 \%$ of residents in Wajir County use liquefied petroleum gas (LPG), and 1\% use paraffin. 95\% use firewood and $4 \%$ use charcoal. Firewood is the most common cooking fuel by gender; $95 \%$ in male and $94 \%$ in female headed households.

Tarbaj constituency has the highest level of firewood use in Wajir County at $99 \%$.This is 14 percentage points above Wajir East constituency, which has the lowest share at $85 \%$. Tarbaj constituency is about 4 percentage points above the county average. Twelve wards, have the highest level of firewood use in Wajir County at 99\%. This is 37 percentage points above Township ward, which has the lowest share at $62 \%$. These twelve wards are 4 percentage points above the county average.

Wajir East constituency has the highest level of charcoal use in Wajir County at 12\%.This is 11 percentage points above Tarbaj constituency. Wajir East constituency is 8 percentage points above the county average. Township ward has the highest level of charcoal use in Wajir County at $31 \%$. This is 31 percentage points more than Tarbaj ward, which has the lowest share. Township ward is 27 percentage points above the county average.

## Lighting

Figure 46.5: Percentage Distribution of Households by Source of Lighting Fuel in Wajir County

Only 3\% of residents in Wajir County use electricity as their main source of lighting. A further 31\% use lanterns, and $17 \%$ use tin lamps. $29 \%$ use fuel wood. Electricity use is mostly common in female headed households at $5 \%$ as compared with male headed households at $3 \%$.

Wajir East constituency has the highest level of electricity use at $15 \%$.That is 15 percentage points above Wajir North constituency, which has no level of electricity use. Wajir East constituency is 12 percentage points above the county average. Township ward has the highest level of electricity use at $36 \%$.That is 36 percentage points above 18 wards, which have no level of electricity use. Township ward is 33 percentage points above the county average.

## Housing

## Flooring

Figure 46.6: Percentage Distribution of Households by Floor Material in Wajir County

In Wajir County, 7\% of residents have homes with cement floors, while $92 \%$ have earth floors. Less than $1 \%$ has wood or tile floors. Wajir East constituency has the highest share of cement floors at $23 \%$. That is 23 percentage points above Tarbaj constituency, which has the lowest share of cement floors. Wajir East constituency is 16 percentage points above the county average. Township ward has the highest share of cement floors at $50 \%$. That is 50 percentage points above Arbajahan ward, which has no share of cement floors. Township ward is 43 percentage points above the county average.

## Roofing

Figure 46.7: Percentage Distribution of Households by Roof Material in Wajir County

In Wajir County, less than 1\% of residents have homes with concrete roofs, while $10 \%$ have corrugated iron sheet roofs. Grass and makuti roofs constitute $89 \%$ of homes, and less than $1 \%$ has mud/dung roofs.

Wajir East constituency has the highest share of corrugated iron sheet roofs at $23 \%$. That is 22 percentage points above Tarbaj constituency, which has the lowest share of corrugated iron sheet roofs. Wajir East constituency is 13 percentage points above the county average. Township ward has the highest share of corrugated iron sheet roofs at $50 \%$. That is 50 percentage points above Tarbaj ward, which has the lowest share of corrugated iron sheet roofs. Township ward is 40 percentage points above the county average.

Tarbaj constituency has the highest share of grass/makuti roofs at $99 \%$. That is 24 percentage points above Wajir East constituency, which has the lowest share of grass/makuti roofs. Tarbaj constituency is 10 percentage points above the county average. Wargadud ward has the highest share of grass/makuti roofs at $100 \%$. This is twice Township ward, which has the lowest share. Wargadud ward is 11 percentage points above the county average.

Walls
Figure 46.8: Percentage Distribution of Households by Wall Material in Wajir County

In Wajir County, 7\% of homes have either brick or stone walls. 7\% of homes have mud/wood or mud/cement walls. $8 \%$ have wood walls. Less than $1 \%$ has corrugated iron walls. $77 \%$ have grass/thatched walls. Less than $1 \%$ has tin or other walls.

Wajir East constituency has the highest share of brick/stone walls at $24 \%$. That is 24 percentage points above Tarbaj constituency, which has the lowest share of brick/stone walls. Wajir East constituency is 17 percentage points above the county average. Township ward has the highest share of brick/stone walls at $51 \%$. That is 51 percentage points above Bur-Der ward, which has no share of brick/stone walls. Township ward is 44 percentage points above the county average.

Wajir North constituency has the highest share of mud with wood/cement walls at $17 \%$.That is 16 percentage points above Wajir East constituency, which has the lowest share of mud with wood/cement. Wajir North constituency is 10 percentage points above the county average. Bute ward has the highest share of mud with wood/ cement walls at $31 \%$. That is 31 percentage points above Ganyure ward, which has the lowest share of mud with wood/cement walls. Bute ward is 24 percentage points above the county average.

## Water

Improved sources of water comprise protected spring, protected well, borehole, piped into dwelling, piped and rain water collection while unimproved sources include pond, dam, lake, stream/river, unprotected spring, unprotected well, jabia, water vendor and others.

In Wajir County, $46 \%$ of residents use improved sources of water, with the rest relying on unimproved sources. There is no significant gender differential in use of improved sources with $46 \%$ of male headed households and $48 \%$ in female headed households using it.

Wajir West constituency has the highest share of residents using improved sources of water at $60 \%$.That is twice Eldas constituency, which has the lowest share using improved sources of water. Wajir West constituency is 14 percentage points above the county average. Dadaja Bulla ward has the highest share of residents using improved sources of water at $98 \%$.That is 97 percentage points above Wagalla ward, which has the lowest share using improved sources of water. Dadaja Bulla ward is 52 percentage points above the county average.

Figure 46.9: Wajir County-Percentage of Households with Improved and Unimproved Sources of Water by Ward

## Sanitation

Only 7\% of residents in Wajir County use improved sanitation, while the rest use unimproved sanitation. Use of improved sanitation is slightly higher in female headed households at $9 \%$ as compared with male headed households at 6\%.

Wajir South constituency has the highest share of residents using improved sanitation at 12\%.That is four times Eldas constituency, which has the lowest share using improved sanitation. Wajir South constituency is 5 percentage points above the county average. Habaswein ward has the highest share of residents using improved sanitation at $32 \%$. That is 32 percentage points above Ganyure ward, which has the lowest share using improved sanitation. Habaswein ward is 25 percentage points above the county average.

Figure 46.10: Wajir County -Percentage of Households with Improved and Unimproved Sanitation by Ward

## About KNBS

The Kenya National Bureau of Statistics (KNBS) is a semi-autonomous organization established under Statistics Act 2006 as the principal agency for collecting, compiling, analyzing, publishing and disseminating statistical information needed for planning and policy formulation and is the custodian of official statistical information. More specifically the Bureau is charged with responsibility of: planning, authorizing, co-coordinating and supervising all official statistical programmes undertaken within the National Statistical System (NSS); establishing standards and promoting the use of best practices and methods in the production and dissemination of statistical information across the NSS; collecting, compiling, analyzing, abstracting and disseminating statistical information on matters specified in the First Schedule of the Statistics Act; conducting population and housing census every ten years, and such other censuses and surveys as the board may determine; and maintaining a comprehensive and reliable national socio-economic database.

## About SID

The Society for International Development (SID) is an international network of individuals and organizations with an interest in development, policy and governance research and dialogue. Since its creation in 1957, SID has consistently been at the forefront of reappraising prevalent development ideas and has confronted the theory and practice of development,challenging existing practices and suggesting alternative approaches. Over the years, three values have been - and remain - at the core of the Society's work - respect for diversity, participation and equity. SID East Africa is incorporated as a Company Limited by Guarantee under the Laws of Kenya. It serves as the Regional Office of the SID International Secretariat which is headquartered in Rome, Italy.
